

Girls on Campus — Full System Architecture

High-level architecture: Website, dashboards, Chrome Extension and future modules connected through one shared backend.

Solid lines = core current architecture • Dashed lines = future/expansion integrations

Opportunity & Student Tracker Data Flow

Public catalog data is separated from each student's private tracker data.

Critical rule

A public opportunity can be saved by many students, but every student's tracker status, notes, tasks, reminders and documents remain private.

Chrome Extension Integration Architecture

The extension uses the same GOC account and backend. It does not need a separate user database.

The private student save and the admin-reviewable extension source are related but should remain separate data layers.

Admin Dashboard Operational Architecture

The Admin Dashboard acts as the platform control center with role-protected workflows and audit logging.

All high-impact actions such as suspension, publication, deletion, payment decisions and moderation actions should create audit records.
